

USE OF INTERNET RESOURCES IN TEACHING FORENSIC MEDICINE

Gamidov Seymur Shukurovich

Khakimov Sarvar Abduazimovich

During the years of independence, the modernization of educational processes in our country and the upbringing of the younger generation have become an integral part of state policy. Of course, at present, in the development of educational processes, an important role is played by the study of the description and classification of regulatory documents, the skills of industry workers in accordance with the requirements of the time, in increasing the potential of higher education professors and teachers, strengthening their qualifications.

In our republic, great importance is attached to strengthening the education system and harmonizing it with modern requirements. In this regard, it is important that the system of training, education, and upbringing of specialists be closely linked with the requirements of reforms. One of the urgent tasks facing us is the training of specialists who meet modern requirements, the improvement of education and all its structural subdivisions based on state requirements.

Currently, in the field of higher education management, every managerial staff and teaching staff must be aware of their rights, obligations, and responsibilities, as stipulated in regulatory legal documents. The development of science and technology requires every pedagogical worker to know how to use Internet resources and how to use them rationally.

With the development of technology, the existence of a single computer has become sufficient for teaching using technical means. The computer has successfully taken on the functions previously performed by television, video and audio technologies, video projectors, slide projectors, and others. Moreover, it leads to a significant increase in the quality of information transmission, storage, and display.

In conclusion, the use of Internet resources in the educational process is important for the student to acquire professional knowledge, to deeply master the field of science by

modeling the studied phenomena and processes, to expand the sphere of independent activity of the student due to the diverse organization of educational activities, to master the strategy of assimilation of educational materials by the student through the use of the capabilities of the artificial intelligence system, to form an information culture in him as a member of the information society, as well as to present the studied processes and phenomena through computer technologies, which leads to an increase in students' interest and activity in the basics of science.
